

# Sampling and Its Types

Sampling is a powerful tool in research, allowing us to gather insights from a smaller group and generalize them to a larger population.

**A** by Aanchal Aggarwal

# What is Sampling?

Sampling involves selecting a subset of individuals from a larger population to represent the characteristics of the whole.

This helps reduce costs, time, and resources, while still providing valuable data for analysis and decision-making.

$$2 \left( \frac{6x}{13} - 11 \right) \Rightarrow y = 4 \cdot \left( \frac{2x}{3} - 10 \right)$$

2 Pay (iam Number

andiam number - (5:37) = 1102)

$$x + 12 + 3.5 \cdot (2) = 2(+25 - +^3 (vc|-13)s) \Rightarrow \frac{Ry}{62} = + \frac{No^2 - 3 - 10}{\sqrt{x} \cdot 38}$$

$$\frac{2 \cdot x \cdot 3}{25} = \frac{35}{25} + (6x \Rightarrow | = 2)$$

$$\frac{R \cdot 13}{61} + \left( \frac{ay}{18} \right) = 4 \cdot (50)$$

$$\frac{2 \cdot x \cdot 2}{18} + \frac{30}{18} + \left( \frac{2}{4} \right) Ac = \left( \frac{2 \cdot 3^2}{28} + - \right) = 5$$

$$\frac{4 \cdot 33}{35} (Cx = 4^2 - 4)$$

$$\frac{2 \cdot 2}{23} = \frac{32}{23} + \left( \frac{22}{28} \right) = y = \left( \frac{ax^2}{16} + -1x \right) = 5$$

$$\frac{2 \cdot 23}{52} + \left( \frac{54}{6} + \frac{12}{12} \right) c \Rightarrow \left( \frac{6ay}{26} + \frac{62}{12} \right) = .10 = th, (12e \cdot 5 + 4 \frac{223}{185} - (ro$$

$$\frac{2 \cdot 21 + 19x \equiv 113}{2-13 (18 \cdot 2512)} = \left( \frac{ax^2}{8} + \frac{21}{2} \right)$$

$$T \cdot ( + ( = 3 ) + 162 - 1$$

$$= 2c \cdot x + \frac{7}{3} \left( \frac{6}{2} + 18 = 45^2 = 4 ( + 130 = 2 ) \right) \quad AB: ) \times 18 \cdot c$$

amen number ye + in  $3 \times 6 - + 25$ )

$$\left( xx + \frac{2}{78} + 95 : 14 \right) = \frac{2 \cdot 3}{103}$$

# Probability Sampling

## Random Selection

Every member of the population has a known, non-zero chance of being selected for the sample.

## Representative Sample

Probability sampling techniques aim to create a sample that accurately reflects the characteristics of the population.

## Statistical Inference

This allows researchers to make statistically valid inferences about the entire population based on the sample data.

# Simple Random Sampling

## Random Selection

Each individual has an equal chance of being selected, like drawing names from a hat.

## Time-Efficient

It's a relatively quick and efficient method for selecting a sample.

## Easy to Implement

Simple random sampling is straightforward to implement using random number generators.

# Systematic Sampling

1

## Regular Intervals

Individuals are selected at regular intervals from a list, starting at a random point.

2

## Efficient for Large Samples

Systematic sampling is efficient for large populations, as it requires less effort than simple random sampling.

3

## Potential Bias

However, there's a risk of bias if the list has a hidden pattern that aligns with the sampling interval.

# Stratified Sampling

1

## Divide and Conquer

The population is divided into subgroups (strata) based on relevant characteristics, like age or gender.

---

2

## Proportional Representation

Random samples are drawn from each stratum proportionally to their size in the population.

---

3

## Increased Accuracy

Stratified sampling ensures that all subgroups are adequately represented in the sample.

# Cluster Sampling

1

## Clusters

The population is divided into clusters, usually geographically based.

2

## Random Selection

A random sample of clusters is selected, and all individuals within those clusters are included.

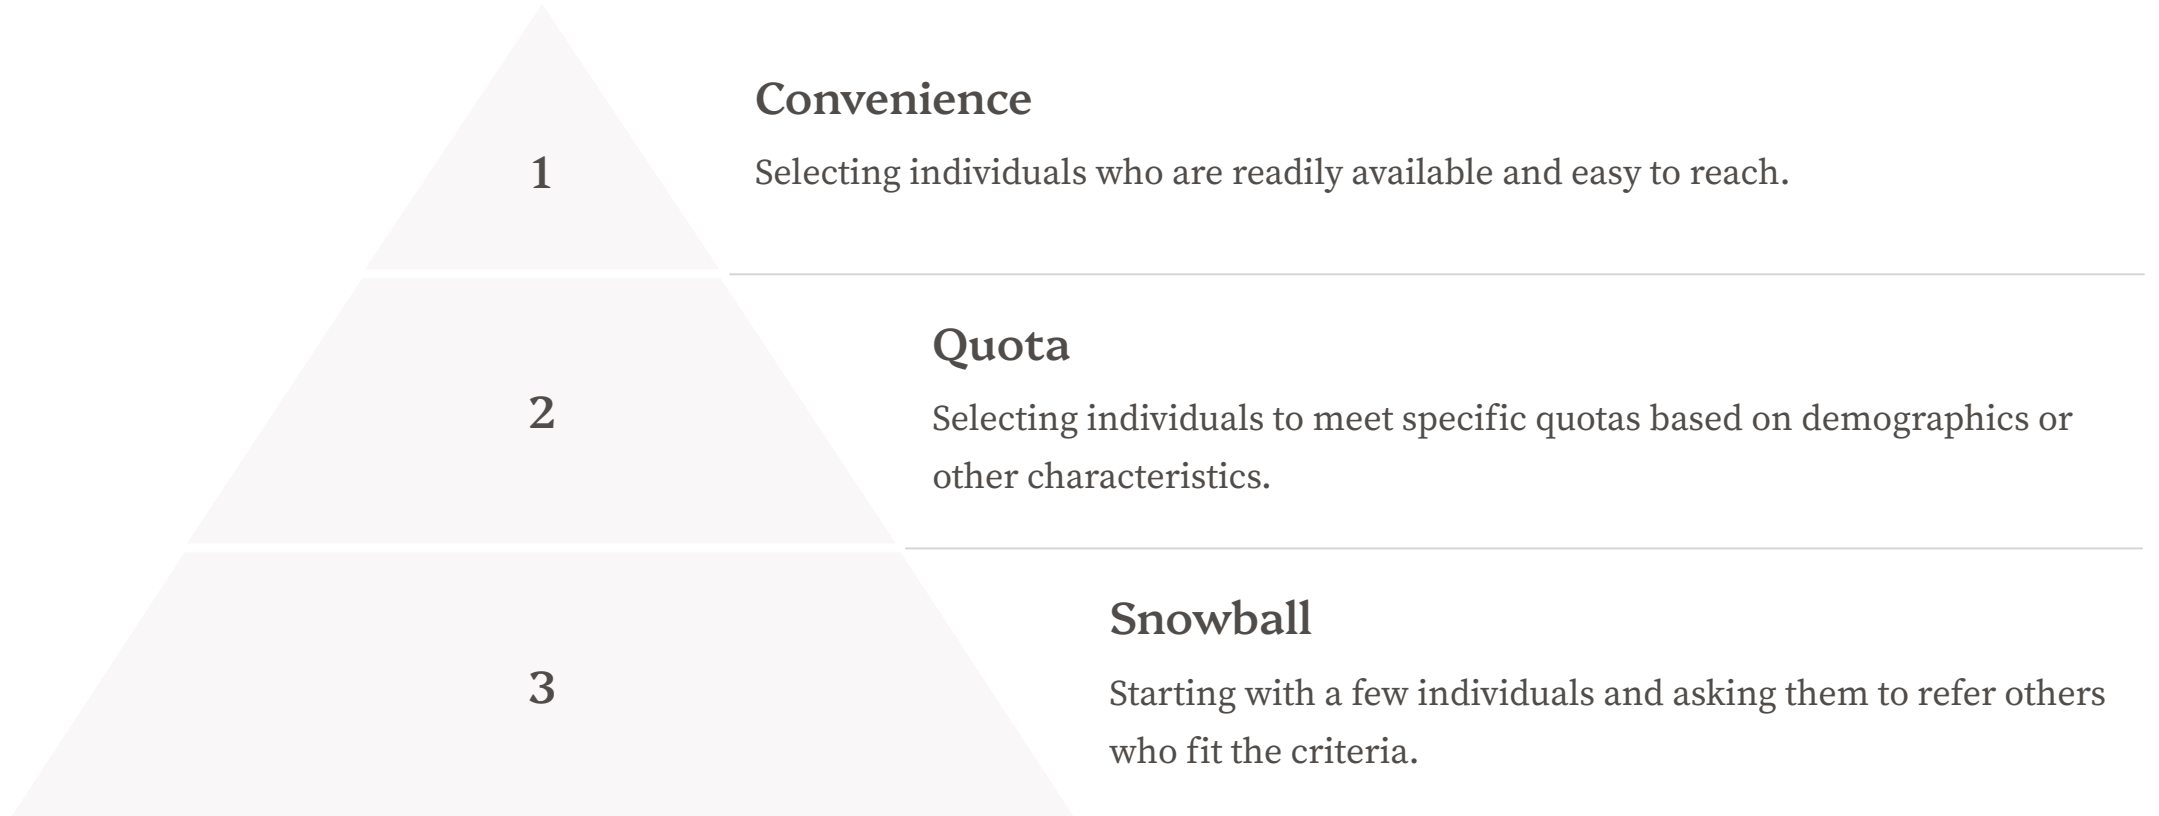

3

## Efficiency

Cluster sampling is efficient for large populations, as it requires fewer data points than simple random sampling.

# Non-Probability Sampling

# Advantages and Limitations of Sampling
