

# *Internet Control Message Protocol*

---

## **Objectives**

*Upon completion you will be able to:*

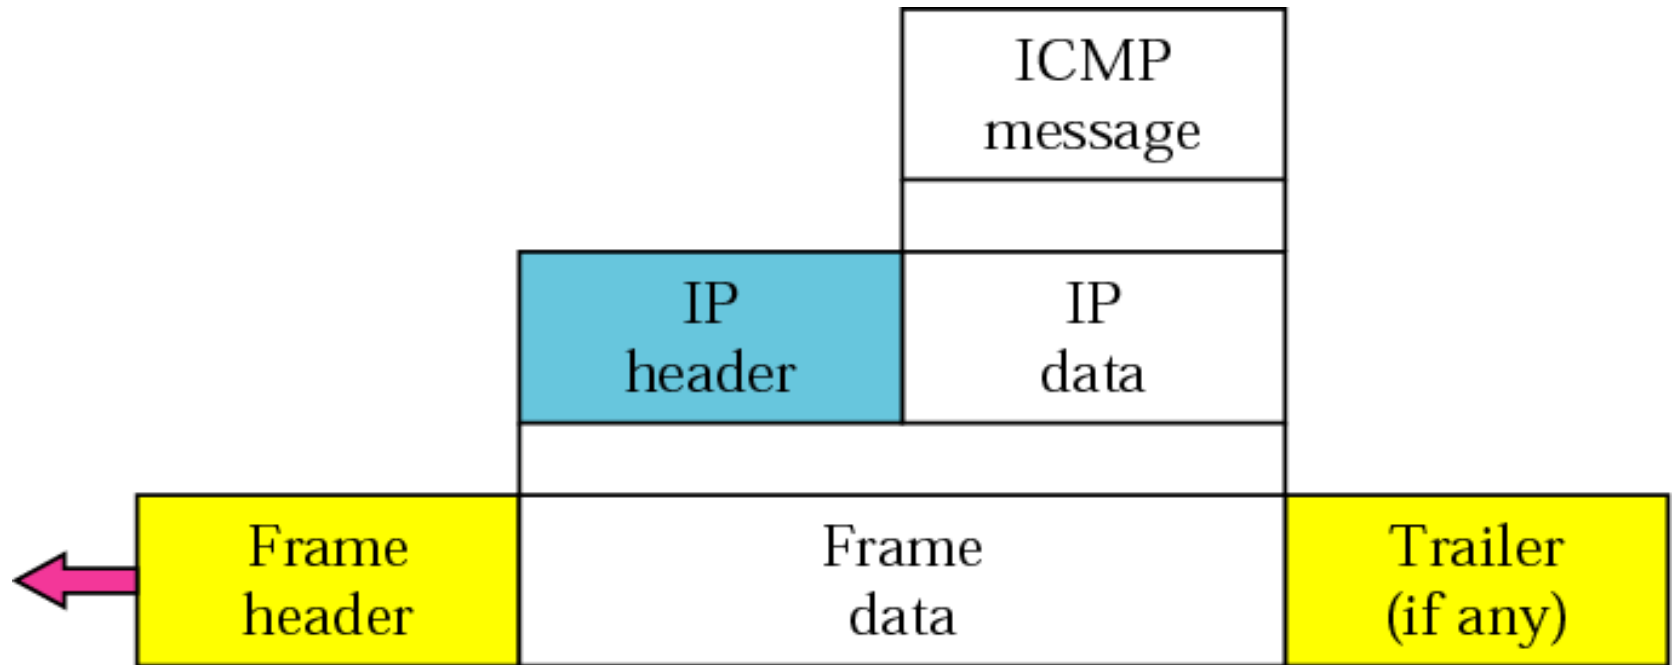

- *Be familiar with the ICMP message format*
- *Know the types of error reporting messages*
- *Know the types of query messages*
- *Be able to calculate the ICMP checksum*
- *Know how to use the ping and traceroute commands*
- *Understand the modules and interactions of an ICMP package*

**Figure 1**

*Position of ICMP in the network layer*

**Figure 9.2** *ICMP encapsulation*

# 9.1 TYPES OF MESSAGES

*ICMP messages are divided into error-reporting messages and query messages. The error-reporting messages report problems that a router or a host (destination) may encounter. The query messages get specific information from a router or another host.*

**Figure 9.3** *ICMP messages*

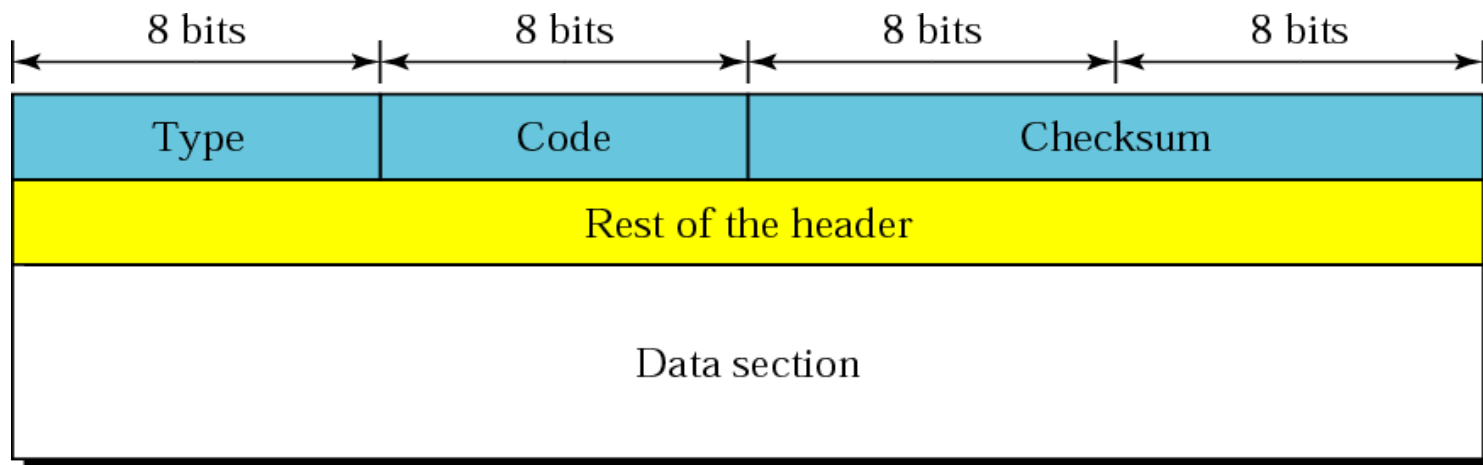

***Table 9.1 ICMP messages***

| <i>Category</i>          | <i>Type</i> | <i>Message</i>                       |
|--------------------------|-------------|--------------------------------------|
| Error-reporting messages | 3           | Destination unreachable              |
|                          | 4           | Source quench                        |
|                          | 11          | Time exceeded                        |
|                          | 12          | Parameter problem                    |
|                          | 5           | Redirection                          |
| Query messages           | 8 or 0      | Echo request or reply                |
|                          | 13 or 14    | Timestamp request or reply           |
|                          | 17 or 18    | Address mask request or reply        |
|                          | 10 or 9     | Router solicitation or advertisement |

## 9.2 MESSAGE FORMAT

*An ICMP message has an 8-byte header and a variable-size data section. Although the general format of the header is different for each message type, the first 4 bytes are common to all.*

**Figure 9.4** *General format of ICMP messages*

## 9.3 ERROR REPORTING

*IP, as an unreliable protocol, is not concerned with error checking and error control. ICMP was designed, in part, to compensate for this shortcoming. ICMP does not correct errors, it simply reports them.*

*The topics discussed in this section include:*

*Destination Unreachable*

*Source Quench*

*Time Exceeded*

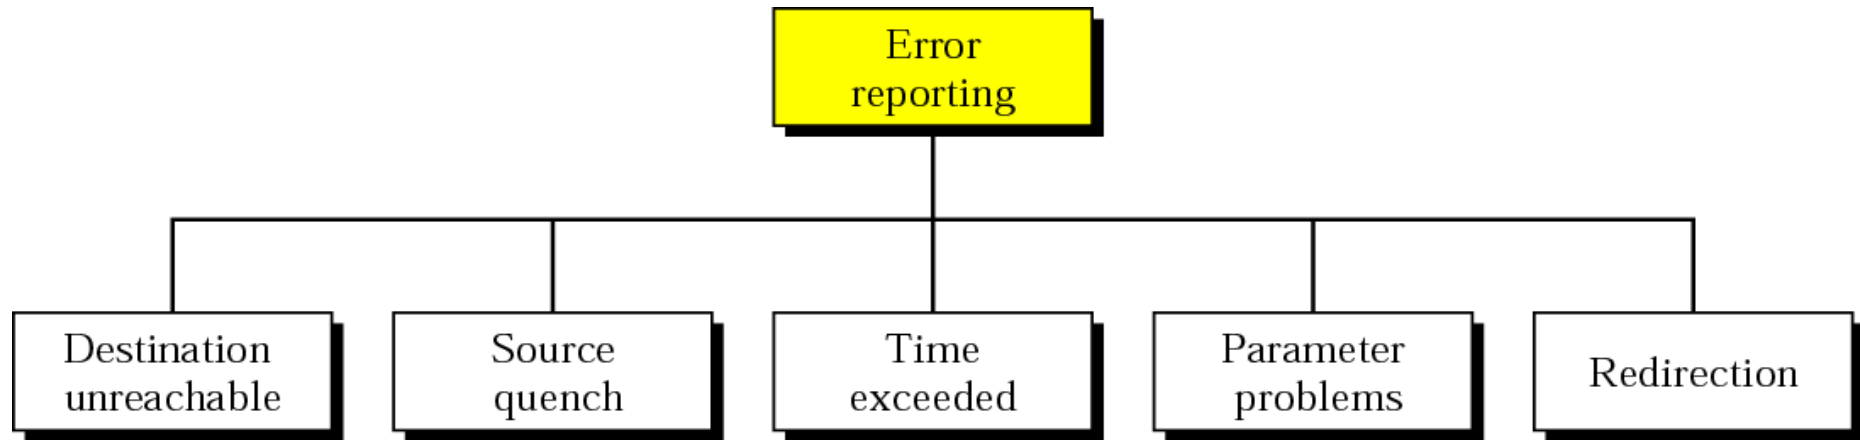

*Parameter Problem*

*Redirection*

*ICMP always reports error messages  
to the original source.*

**Figure 9.5** *Error-reporting messages*

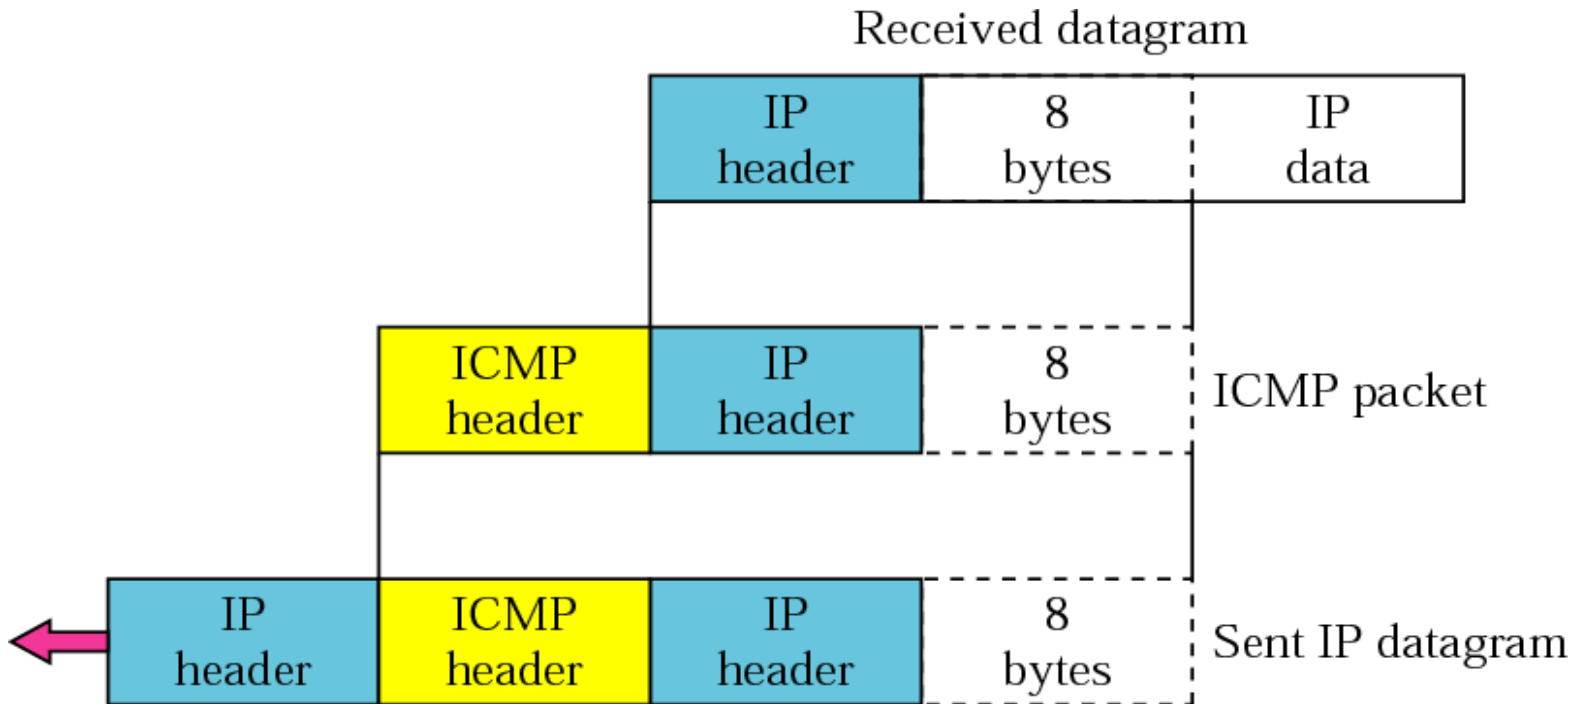

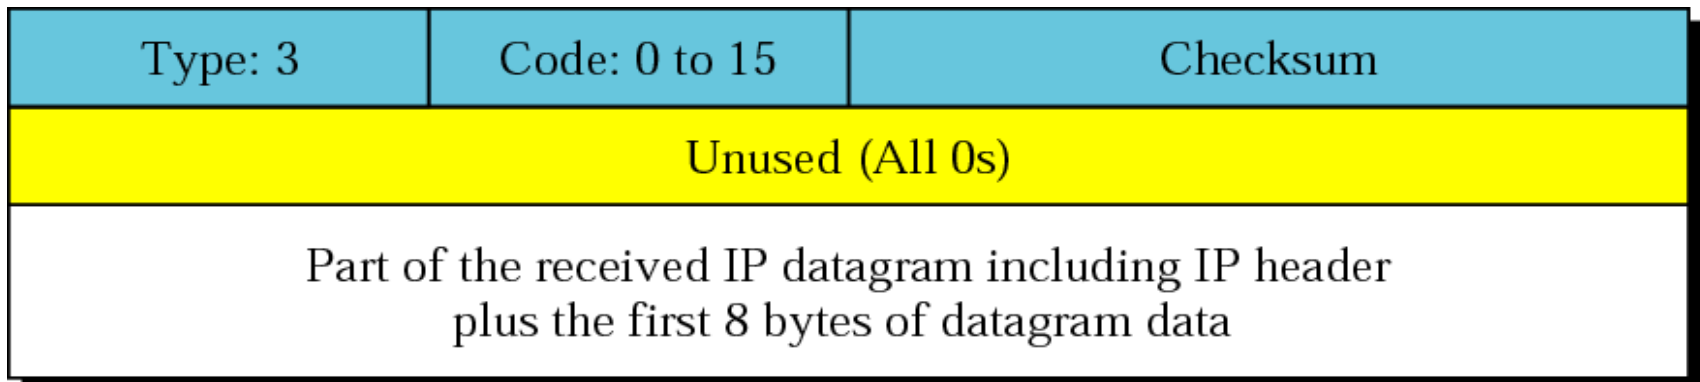

*The following are important points about ICMP error messages:*

- No ICMP error message will be generated in response to a datagram carrying an ICMP error message.*
- No ICMP error message will be generated for a fragmented datagram that is not the first fragment.*
- No ICMP error message will be generated for a datagram having a multicast address.*
- No ICMP error message will be generated for a datagram having a special address such as 127.0.0.0 or 0.0.0.0.*

**Figure 9.6** *Contents of data field for the error messages*

**Figure 9.7** *Destination-unreachable format*

*Destination-unreachable messages with codes 2 or 3 can be created only by the **destination host**.*

*Other destination-unreachable messages can be created only by **routers**.*

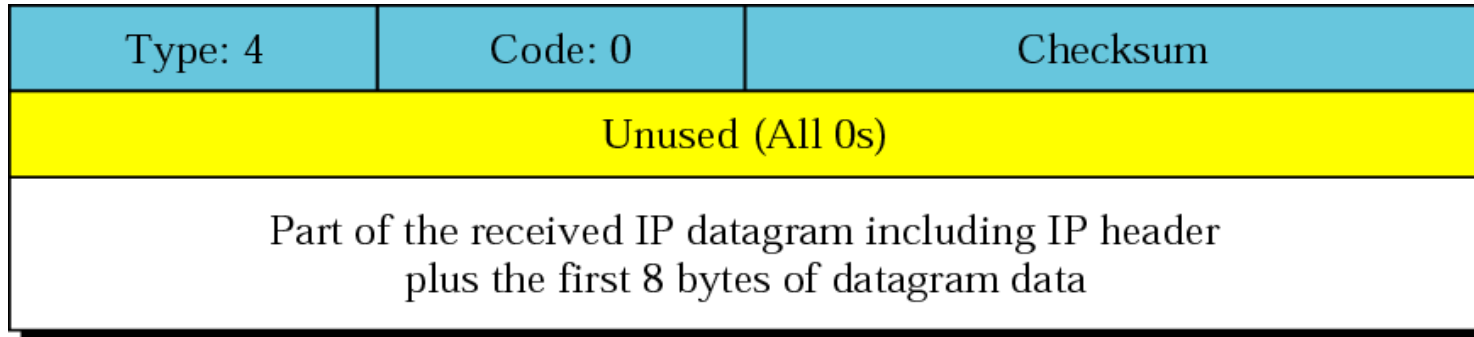

*A router cannot detect all problems that prevent the delivery of a packet.*

*There is no flow-control mechanism in the IP protocol.*

**Figure 9.8** *Source-quench format*

*A source-quench message informs the source that a datagram has been discarded due to congestion in a router or the destination host.*

*The source must slow down the sending of datagrams until the congestion is relieved.*

*One source-quench message is sent for each datagram that is discarded due to congestion.*

*Whenever a router decrements a datagram with a time-to-live value to zero, it discards the datagram and sends a time-exceeded message to the original source.*

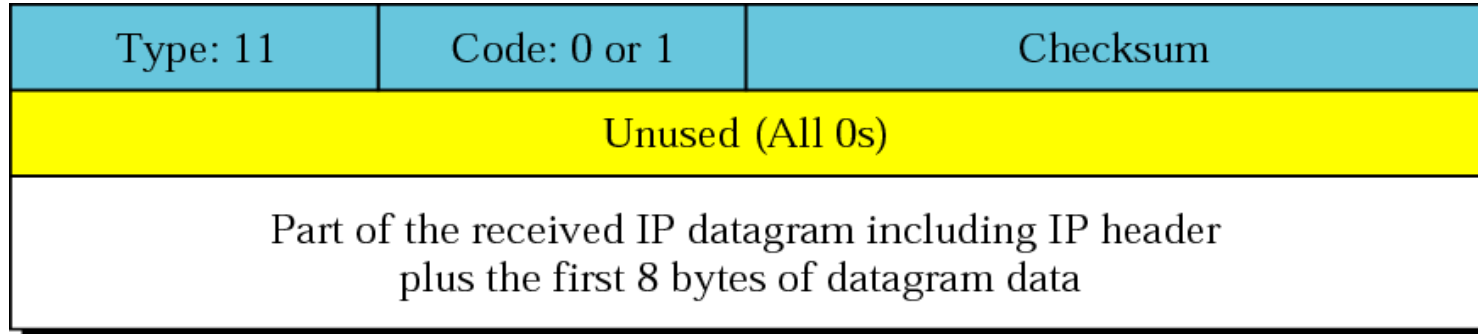

*When the final destination does not receive all of the fragments in a set time, it discards the received fragments and sends a time-exceeded message to the original source.*

*In a time-exceeded message, **code 0** is used only by routers to show that the value of the time-to-live field is zero. **Code 1** is used only by the destination host to show that not all of the fragments have arrived within a set time.*

**Figure 9.9** *Time-exceeded message format*

*A parameter-problem message can be created by a router or the destination host.*

**Figure 9.10** *Parameter-problem message format*

|                                                                                                 |                 |          |
|-------------------------------------------------------------------------------------------------|-----------------|----------|
| Type: 12                                                                                        | Code: 0 or 1    | Checksum |
| Pointer                                                                                         | Unused (All 0s) |          |
| Part of the received IP datagram including IP header<br>plus the first 8 bytes of datagram data |                 |          |

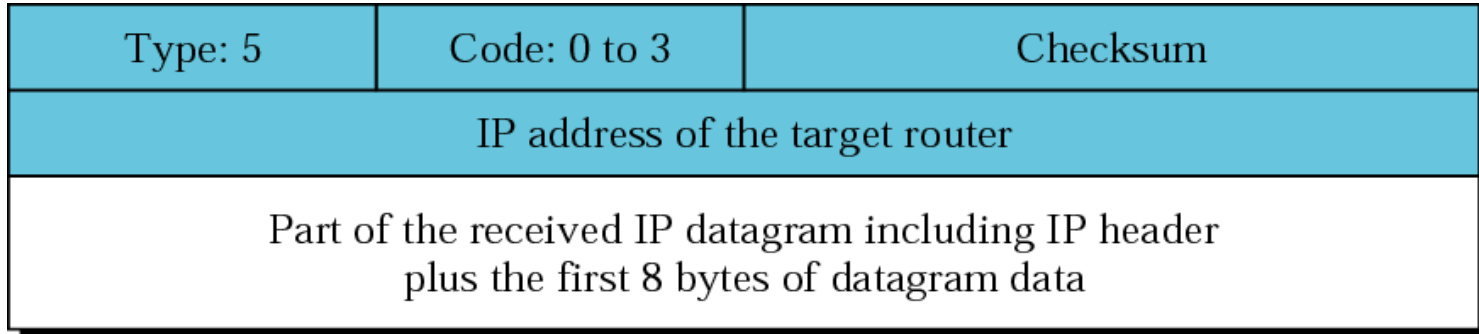

**Figure 9.11** *Redirection concept*

*A host usually starts with a small routing table that is gradually augmented and updated. One of the tools to accomplish this is the redirection message.*

**Figure 9.12** *Redirection message format*

*A redirection message is sent from a router to a host on the same local network.*

## 9.4 QUERY

*ICMP can also diagnose some network problems through the query messages, a group of four different pairs of messages. In this type of ICMP message, a node sends a message that is answered in a specific format by the destination node.*

*The topics discussed in this section include:*

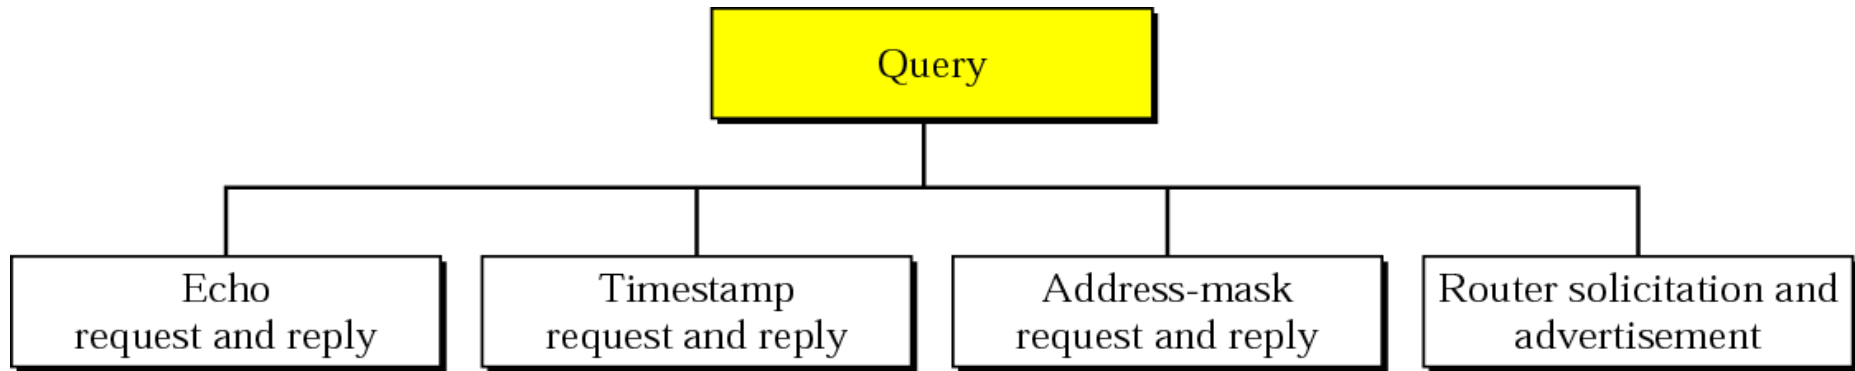

*Echo Request and Reply*

*Timestamp Request and Reply*

*Address-Mask Request and Reply*

*Router Solicitation and Advertisement*

**Figure 9.13** *Query messages*

*An echo-request message can be sent by a host or router. An echo-reply message is sent by the host or router which receives an echo-request message.*

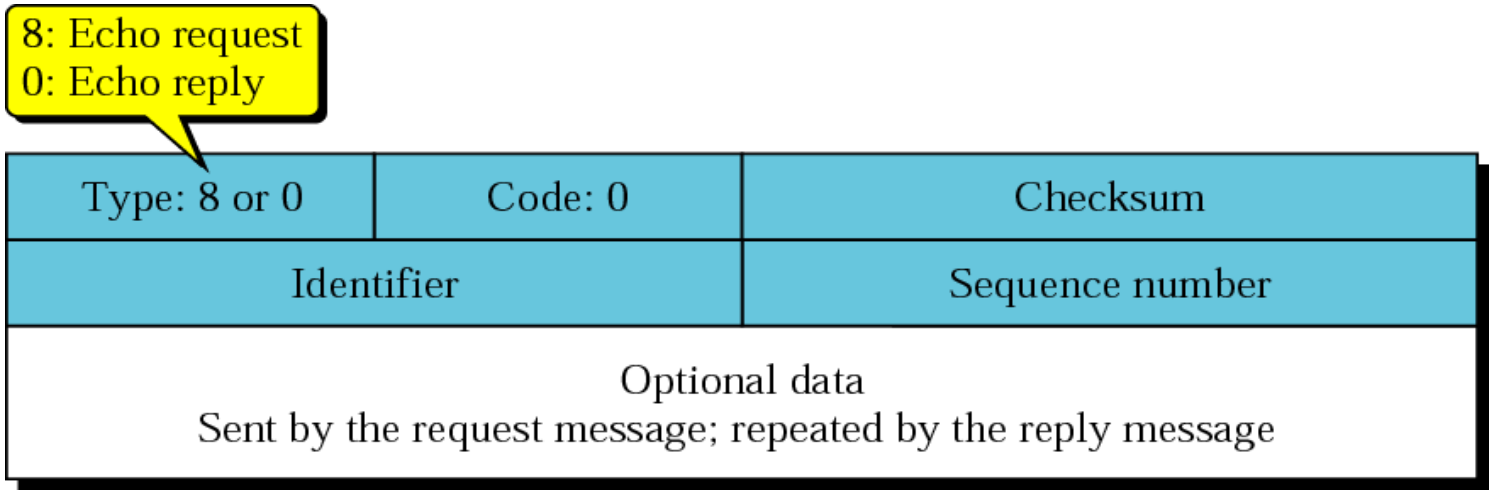

*Echo-request and echo-reply messages can be used by network managers to check the operation of the IP protocol.*

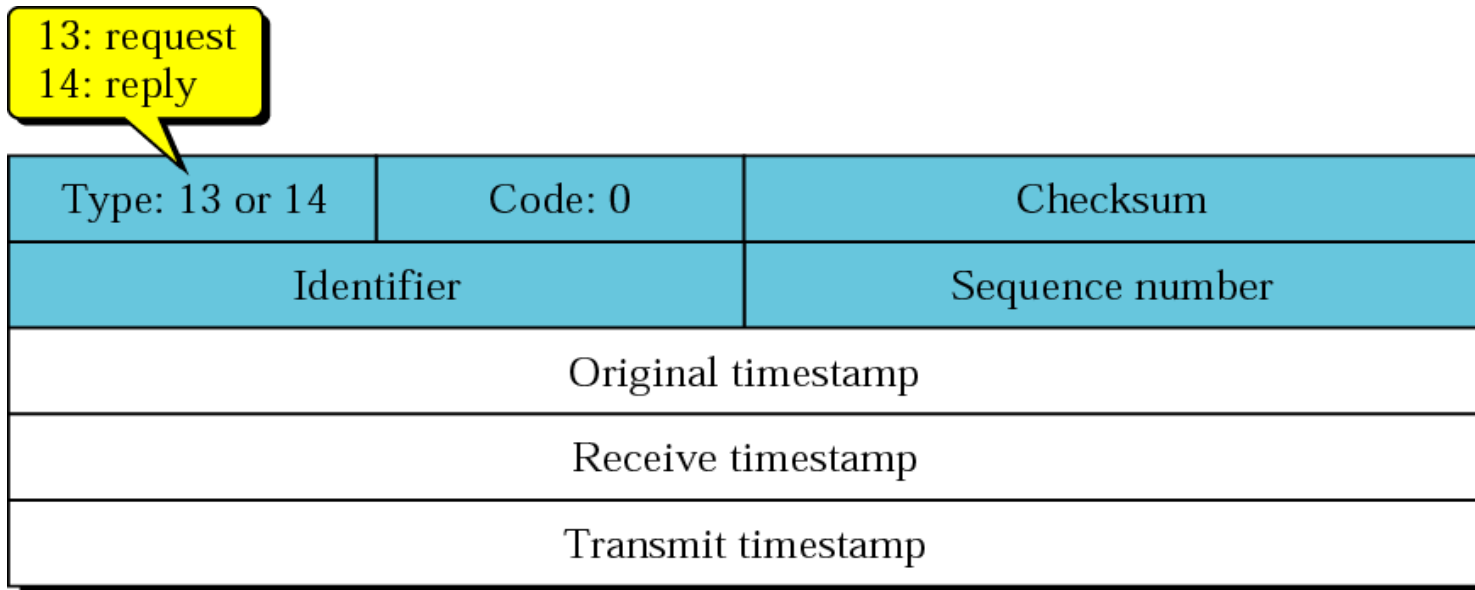

*Echo-request and echo-reply messages can test the reachability of a host. This is usually done by invoking the **ping** command.*

**Figure 9.14** *Echo-request and echo-reply messages*

**Figure 9.15** *Timestamp-request and timestamp-reply message format*

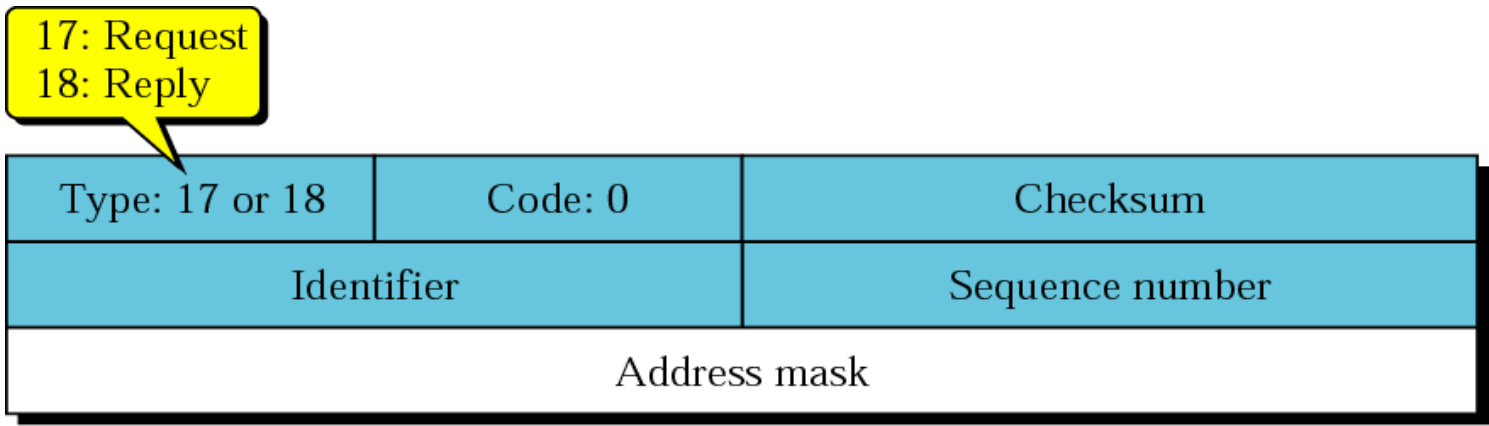

*Timestamp-request and timestamp-reply messages can be used to calculate the round-trip time between a source and a destination machine even if their clocks are not synchronized.*

*The timestamp-request and timestamp-reply messages can be used to synchronize two clocks in two machines if the exact one-way time duration is known.*

**Figure 9.16** *Mask-request and mask-reply message format*

**Figure 9.17** *Router-solicitation message format*

|            |         |                 |
|------------|---------|-----------------|
| Type: 10   | Code: 0 | Checksum        |
| Identifier |         | Sequence number |

**Figure 9.18** *Router-advertisement message format*

|                      |                    |          |
|----------------------|--------------------|----------|
| Type: 9              | Code: 0            | Checksum |
| Number of addresses  | Address entry size | Lifetime |
| Router address 1     |                    |          |
| Address preference 1 |                    |          |
| Router address 2     |                    |          |
| Address preference 2 |                    |          |
| •<br>•<br>•          |                    |          |

## 9.5 CHECKSUM

*In ICMP the checksum is calculated over the entire message (header and data).*

*The topics discussed in this section include:*

*Checksum Calculation*

*Checksum Testing*

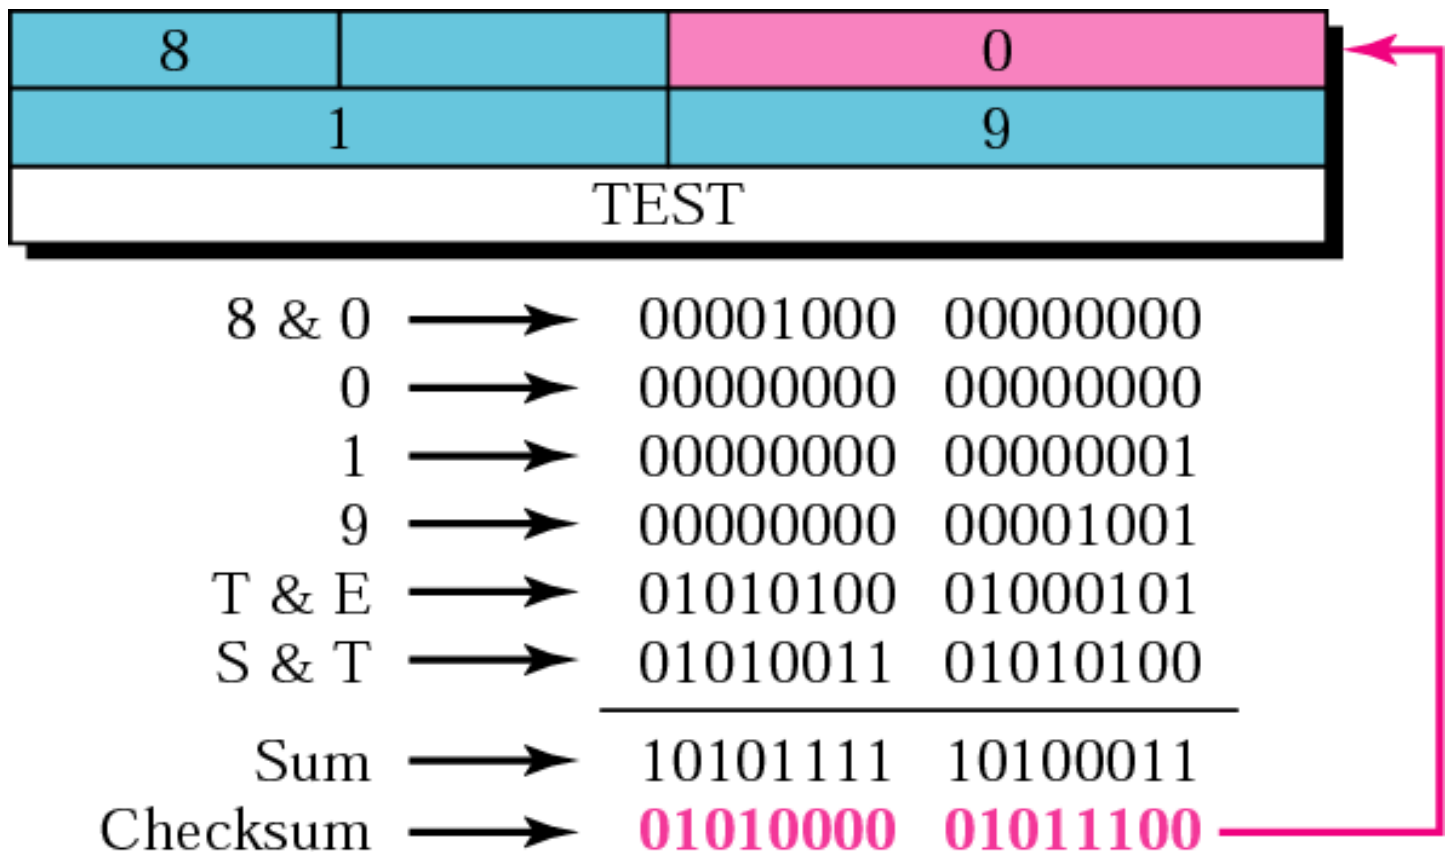

## *EXAMPLE 1*

*Figure 9.19 shows an example of checksum calculation for a simple echo-request message (see Figure 9.14). We randomly chose the identifier to be 1 and the sequence number to be 9. The message is divided into 16-bit (2-byte) words. The words are added together and the sum is complemented. Now the sender can put this value in the checksum field.*

**See Next Slide**

**Figure 9.19** *Example of checksum calculation*

## 9.6 DEBUGGING TOOLS

*We introduce two tools that use ICMP for debugging: **ping** and **tracert**.*

*The topics discussed in this section include:*

*Ping*

*Tracert*

**Figure 9.20** *The traceroute program operation*

## 9.7 ICMP PACKAGE

*To give an idea of how ICMP can handle the sending and receiving of ICMP messages, we present our version of an ICMP package made of two modules: an input module and an output module.*

*The topics discussed in this section include:*

*Input Module*

*Output Module*

**Figure 9.21** *ICMP package*
